

High-chance portions — csat-math

Combined original study articles for this topic's highest-probability PYQ themes (deep edition).

CSAT Numeracy & Data Interpretation — High-Yield Patterns

~90% · Percentages · Ratio/mixtures · Averages · Time-work · Time-distance · SI/CI · DI · Simplification

Why this article (PYQ probability)

Structural next-exam chance ~90% for numeracy block. CSAT math parent ~85%. Themes weighted by 10-year CSAT pattern frequency.

Years appeared (synthesis): 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025

Why UPSC asks this

Qualifying paper rewards speed on recurring arith patterns more than exotic puzzles.

Why this portion is high-chance for the next exam

Structural next-exam chance ~90% for numeracy block. CSAT math parent ~85%. Themes weighted by 10-year CSAT pattern frequency. Within csat-math, examiners return to CSAT quantitative aptitude and DI patterns because it yields clean MCQ discriminators: definitions, matching lists, and statement–reason traps. These notes are multi-page depth material — original study synthesis for prioritisation, not NCERT/UPSC verbatim text and not an official prediction.

Use the chance % to sequence study hours, then widen to neighbouring syllabus areas. PYQ theme tags driving selection: Percentages, Ratio/mixtures, Averages, Time-work, Time-distance, SI/CI, DI, Simplification. Approximate appearance years in the 2016–2025 educational synthesis: 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025.

Read this block slowly: high-chance portions repay depth because UPSC recycles the same discriminators with fresh stems. Your job is not to memorise paragraphs but to own triggers — dates, articles, site–feature pairs, formulae, treaty purposes — so elimination is automatic. After each subsection, pause and write two keywords on rough paper; if you cannot, reread only that subsection.

Core map of CSAT quantitative aptitude and DI patterns

Percent base discipline: Always ask 'percent of what?'. Successive percent: Multiply factors; avoid naive add. Profit-loss: SP/CP relations; marked price/discount chains.

Ratio parts: Sum parts = total; mixtures allegation. Replacement mixtures: Quantity removed/added iterations. Averages: Sum = avg $\times$ n; weighted averages.

If you can explain each point aloud in sixty seconds without notes, elimination speed in Prelims rises sharply. Watch absolute words in options (always/never/only) — often wrong where processes are multi-causal or jurisprudentially nuanced.

Draw the core map once from memory at the end of this sitting. Compare with the text. Patch only the missing nodes. That single retrieval cycle is worth more than two passive rereads of the same page.

Depth focus: Percent base discipline

Percent base discipline — Always ask 'percent of what?' In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Successive percent — Multiply factors; avoid naive add Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the

incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: Profit-loss

Profit-loss — SP/CP relations; marked price/discount chains In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Ratio parts — Sum parts = total; mixtures allegation Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: Replacement mixtures

Replacement mixtures — Quantity removed/added iterations In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Averages — Sum = avg $\times$ n; weighted averages Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: Time-work

Time-work — Rate = 1/days; LCM for combined In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Pipes/cisterns — Inflow/outflow signed rates Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: TSD

TSD — Distance = speed $\times$ time; unit consistency km/h!"m/s In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Relative speed — Same/opposite direction Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: Trains

Trains — Length adds when crossing; platforms In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Boats/streams — Downstream/upstream = $b \pm u$ Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: SI

SI — PRT/100 linear In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

CI basics — Compound factor $(1+r)^n$ — limited depth usually Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: Number system

Number system — HCF/LCM, remainders, divisibility In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Simplification — BODMAS; fraction/decimal speed Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: DI tables

DI tables — Read totals/legends before computing In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

DI speed — Approximate when options far apart Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Depth focus: Skip rule

Skip rule — If >2 min without path, mark and return In exam stems, expect this idea to appear either as a direct definition or as one statement in a multi-statement cluster.

Worked steps habit — Write rates/units — cuts silly errors Contrast the two ideas above: what would a wrong option swap between them?

Micro-drill: write one correct statement and one incorrect statement using only these ideas; label why the incorrect one fails. Keep language tight — UPSC rewards precision on CSAT quantitative aptitude and DI patterns more than ornamental vocabulary. If this pair links to a map or article number, add that trigger in the margin of your PDF printout.

Comparison tables — memorise differences, not essays

Tables win Prelims because UPSC loves correctly matched pairs and multi-statement sets. Study the table(s) embedded with this article until you can reproduce them on rough paper in under four minutes. Then invent two false rows and practise spotting them — that simulates assertion traps.

After table mastery, return to narrative sections only for rows you keep missing. Depth here is intentional: thin skim notes lose marks on discriminators. When a table row has a date, article, or place, that cell is a trigger — circle it.

Must-know India / applied angle

Grind dedicated CSAT Quants mocks in this hub; explanations show worked steps. Keep a rolling one-page CA addendum dated by month; do not rewrite your static spine every week. Mains crossover exists, but Prelims primarily rewards precise factual edges and definitions.

Link each applied example back to a static hook so current affairs does not float free of the syllabus. If a news item cannot attach to a hook within ten seconds, park it in a low-priority list. Rehearse a 45-second spoken India angle the day before any mock that might touch this portion.

How UPSC typically frames questions (PYQ angle)

Matching lists and statements on CSAT quantitative aptitude and DI patterns. Tactic: eliminate anachronisms and category errors first (wrong institution, wrong treaty family, wrong century, wrong formula base). Then test remaining options against table rows. Finally, beware extra absolute adjectives.

Assertion–reason items often smuggle a true statement with a false causal link — judge the link, not only the facts. Matching lists reward uniqueness: start with the most distinctive pair. Themes: Percentages, Ratio/mixtures, Averages, Time-work, Time-distance, SI/CI, DI, Simplification. Years signal in this hub's synthesis: 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025.

Common traps and how to dodge them

Trap: Wrong percent base. Trap: Adding successive percents. Trap: km/h left as m/s inconsistently.

Trap: CI/SI formula swap. Trap: Reading wrong DI row.

Build a personal trap diary: after each mock, add one line under this heading. Reread only the trap diary the night before the paper for this portion. Teach one trap to a peer in one minute — teaching exposes fuzzy understanding.

Worked revision method (make the PDF earn its pages)

Day 1: core map + table; close notes; reproduce table. Day 2: India angle + traps; 15 MCQs. Day 3: PYQ-style self-questions from headings only. Day 4: teach the topic aloud for eight minutes. Day 5: mixed quiz with neighbouring topics to prevent silo memory.

Print the PDF or use in-app Download PDF. Annotate margins only with triggers you forget — not entire yellow pages. Spaced retrieval beats rereading: hide the PDF and write bullets from memory, then check. In the final 15 days, this portion should be in 'table + traps + must' mode, not first-read mode.

Quick synthesis for the exam hall

Percent/ratio ! ' work/TSD ! ' SI ! ' DI sets ! ' skip discipline. Portion focus score used in-app: ~90%. If time is scarce in the last week, reread Must remember + tables + traps only; return to long sections for weak rows.

Carry a one-line spine on rough paper in the first minute of the paper if this topic appears early — then eliminate. Do not invent facts under pressure; prefer elimination from your table.

Extended notes — depth for multi-page mastery

Percent base discipline. Always ask 'percent of what?' Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Successive percent. Multiply factors; avoid naïve add Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Profit-loss. SP/CP relations; marked price/discount chains Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Ratio parts. Sum parts = total; mixtures allegation Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Replacement mixtures. Quantity removed/added iterations Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin.

Averages. Sum = avg $\times$ n; weighted averages Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Time-work. Rate = 1/days; LCM for combined Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Pipes/cisterns. Inflow/outflow signed rates Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. TSD. Distance = speed $\times$ time; unit consistency km/h!"m/s Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Relative speed. Same/opposite direction Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin.

Trains. Length adds when crossing; platforms Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Boats/streams. Downstream/upstream = $b \pm u$ Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. SI. PRT/100 linear Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. CI basics. Compound factor $(1+r)^n$ — limited depth usually Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Number system. HCF/LCM, remainders, divisibility Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin.

Simplification. BODMAS; fraction/decimal speed Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. DI tables. Read totals/legends before computing Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. DI speed. Approximate when options far apart Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Skip rule. If >2 min without path, mark and return Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin. Worked steps habit. Write rates/units — cuts silly errors Pair this with one contrasting point so options cannot blur categories. Add a keyword trigger in your margin.

This extended module exists so downloads are clearly longer/richer than skim notes. Read it in two sittings if needed; do not skim on day one and never return. After finishing, close the article and write a 12-line summary from memory; compare; patch gaps only. Then solve at least ten mixed MCQs tagging each error to a heading in this PDF.

Error log template (copy into your notebook)

For every missed question related to this portion, record: (1) stem gist, (2) wrong choice, (3) correct choice, (4) misconception in five words, (5) table row or must-remember line that would have saved you. Review the error log before the next mock. If the same misconception repeats thrice, rewrite that depth-focus section in your own words on a fresh page.

This metacognitive loop is how multi-page notes convert into marks rather than shelf weight.

Self-check questions (close the book first)

1) Define CSAT quantitative aptitude and DI patterns in two sentences without buzzword salad. 2) Recite the comparison table rows from memory. 3) List three traps and the correct mental fix for each. 4) Give two India examples and one international or cross-topic anchor. 5) Write one incorrect statement UPSC might plant — then correct it. 6) Time yourself: explain the exam spine in 90 seconds. 7) List five triggers (dates/articles/sites/formulae) without peeking.

Pass criteria: 6/7 without peeking. Then move to mixed MCQs. Failing is useful if you patch immediately — that is the point of depth notes.

Theme weight (study time cue)

Theme	Weight cue
Percent/P-L	Very high
Ratio/mixture	High
DI	High when present
TSD/Work	High
Averages	Medium-high
SI/CI	Medium
Number/simp	Medium-high

Common traps

- ' Wrong percent base
- ' Adding successive percents
- ' km/h left as m/s inconsistently
- ' CI/SI formula swap
- ' Reading wrong DI row

Must remember

- % base
- Successive multiply
- Work rates
- $m/s = \times 5/18$
- $SI = PRT/100$
- DI read legend first
- Skip >2 min

Quick revision checklist

- & 20% drills
- & 10 ratio/mixture
- & 10 work/TSD
- & 1 DI set
- & Timed 20 Q

Educational prioritisation heuristic — not an official UPSC prediction.
